Human Genotyping Arrays

PRODUCT OVERVIEW

Human genotyping arrays are a robust and well-established tool for studies, such as validation, targeting common variants in large sample populations. Often used for genome-wide association studies (GWAS), arrays offer a high-throughput, cost-effective solution. Our arrays feature rapid data delivery with well-established analytical methods allowing for streamlined interpretation of results.

The Human Omni Express + Exome Array offers comprehensive coverage of the genome with 940,000 markers, 240,000 of which provide focused coverage of human exonic content, representing diverse populations and a range of common conditions.

Our Human Psych Array offers >50,000 psychiatric disease-focused markers selected by a consortium of psychiatric genomics experts and is used by the Broad Institute Stanley Center for Psychiatric Research for a multitude of different studies investigating psychiatric diseases and disorders, including Schizophrenia* and Post Traumatic Stress Disorder (PTSD).

The MEGA, Multi-Ethnic Genotyping Array, offers >1.7 million markers with both genome-wide and exome-wide targets. It detects both common and rare variants across the most commonly studied five superpopulations and the imputation of variants in a vast number of subpopulations.

A genomic tool used for research applications is the Global Screening Array. Applications include disease risk profiling studies, pharmacogenomics research, wellness characterization, and complex disease discovery.

It offers >640,000 markers including both genome-wide and exonic markers.

Our genotyping array products feature Illumina BeadChip technology, offering industry-leading accuracy and reliability. Their highly optimized tag SNP content has been selected based on large-scale genomic data generated at the Broad Institute and other leading institutions. Included is analysis in our state of the art calling pipeline that delivers SNP calls shortly after processing in the laboratory and is compatible with other industry analysis tools.

PRODUCT REQUIREMENTS:

• 160ng of DNA (per sample) of input - Volume: 8ul, Concentration: 20ng/ul
• Fresh/frozen tissue and blood preferably yielding >500ng of DNA
• Minimum sample data including collaborator participant ID, collaborator ID, gender
• A HapMap control is required and included in the price for every set of samples
